
Question: when a price moves little after news, does that show that the news had no effect?
Theory
Sections 2.1–2.2 · RQ1
constructive argument
Net versus component absence (Equations (2) and (3))
Two worlds with identical observables (Figure 3)
Partial-identification bounds: observable and oracle
Known-truth simulation
Section 2.5 · RQ1–RQ2
known truth
10 scenarios × 100 replications; 6 learners
Absence diagnostics against population prevalence (Figure 4, Table S5)
Latent-MSE comparisons with positive controls (Table 1)
Repairs: volume λ, text rule q, nonlinear learners; bounds evaluated (Table 2)
Thai bank pilot
Sections 2.4, 2.6–2.8 · RQ3–RQ7
retrospective, exploratory
Data audit and provenance gates: 8 banks, 11,440 news records (Tables S6 and S13)
RDFL labels from price response and trading volume (Figure 2)
7 quarterly folds, 5-session purge, exact-overlap exclusion (Figure S1)
5 learners evaluated on 2197 identical stock-days
Paired moving-block bootstrap, Holm, ±2% margin (Table 4, Figure 5, Table S7)
Mechanism: RDFL component and pipeline ablations (Tables 3 and S8)
Sensitivity: near-duplicates, label settings (Table S4), staleness
U.S. bank replication
Sections 2.6, 3.8 · RQ8
hash-locked before outcomes
FNSPID inspected before the freeze: article counts and dates only
Protocol, 7 hypotheses and all executed code hash-locked
Labels, folds, learners and inference reused unchanged
7 banks, 1874 stock-days: hypotheses scored (Table 5, Figure 6)
Deviations from the protocol logged
Conclusions and scope (Sections 4 and 5)
